

Diagnosis and prevention in those at risk

Many health care professionals do not know enough about HF. Many may not recognise HF symptoms in their patients as a result

Time is critical with HF:

A delay to hospital treatment as little as 4-6 hours after acute onset of HF symptoms appear can increase a patient's risk of death.¹

The risk of developing HF can be reduced by as much as 80%

through the adoption of healthier lifestyles and treatment of cardio-vascular risk factors.

Risk

There are clear

'red flag'

symptoms to look for¹

-  Shortness of breath
 -  Fatigue
 -  Swollen limbs
-
